

IRP Public Stakeholder Meeting

October 11, 2022

Welcome and Safety Share

Richard Leger

Senior Vice President Indiana Electric

Tips to Avoid Distractions While Driving

- Make adjustments before you get underway. Address vehicle systems like your GPS, seats, mirrors, climate controls and sound systems before hitting the road. Decide on your route, and check traffic conditions ahead of time.
- Secure children and pets before getting underway. If they need your attention, pull off the road safely to care for them. Reaching into the backseat can cause you to lose control of the vehicle.
- Put aside your electronic distractions. Don't use cell phones while driving – handheld or handsfree – except in absolute emergencies. Never use text messaging, email functions, video games or the internet with a wireless device, including those built into the vehicle, while driving.
- If another activity demands your attention, instead of trying to attempt it while driving, pull off the road and stop your vehicle in a safe place. To avoid temptation, power down or stow devices before heading out.
- As a general rule, if you cannot devote your full attention to driving because of some other activity, it's a distraction. Take care of it before or after your trip, not while behind the wheel.

Follow Up Information From First IRP Stakeholder Meeting

Matt Rice

Director, Regulatory and Rates

Agenda

| Time | | |
|------------|--|--|
| 8:30 a.m. | Sign-in/Refreshments | |
| 9:30 a.m. | Welcome, Safety Message | Richard Leger, CenterPoint Energy Senior Vice President Indiana Electric |
| 9:40 a.m. | Follow Up Information From First IRP Stakeholder Meeting | Matt Rice, CenterPoint Energy Director Regulatory & Rates |
| 10:20 a.m. | All-Source RFP Update | Drew Burczyk, Consultant, Resource Planning & Market Assessments, 1898 & Co. |
| 10:50 a.m. | Break | |
| 11:05 a.m. | Draft Resource Inputs | Kyle Combes, Project Manager, Resource Planning & Market Assessments, 1898 & Co. |
| 11:40 a.m. | Lunch | |
| 12:20 p.m. | Final Load Forecast | Michael Russo, Forecast Consultant - Itron |
| 1:05 p.m. | Probabilistic Modeling Approach and Assumptions | Brian Despard, Project Manager, Resource Planning & Market Assessments, 1898 & Co. |
| 1:50 p.m. | Break | |
| 2:05 p.m. | Portfolio Development | Matt Lind, Director, Resource Planning & Market Assessments, 1898 & Co. |
| 2:35 p.m. | Draft Reference Case Modeling Update | Matt Lind, Director, Resource Planning & Market Assessments, 1898 & Co. |
| 2:45 p.m. | Stakeholder Questions and Feedback | Moderated by Matt Lind, Director, Resource Planning & Market Assessments, 1898 & Co. |
| 3:15 p.m. | Adjourn | |

Meeting Guidelines

1. Please hold most questions until the end of each presentation. Time will be allotted for questions following each presentation. (Clarifying questions about the slides are fine throughout)
2. For those on the webinar, please use the “React” feature in Microsoft Teams (shown at the bottom of this page) to raise your hand if you have a question and we will open your (currently muted) phone line for questions within the allotted time frame. You may also type in questions in the Q&A feature in Microsoft Teams.
3. The conversation today will focus on resource planning. To the extent that you wish to talk with us about other topics we will be happy to speak with you in a different forum.
4. At the end of the presentation, we will open up the floor for “clarifying questions,” thoughts, ideas, and suggestions.
5. There will be a parking lot for items to be addressed at a later time.
6. CenterPoint Energy does not authorize the use of cameras or video recording devices of any kind during this meeting.
7. Questions asked at this meeting will be answered here or later.
8. We will do our best to capture notes but request that you provide written feedback (concepts, inputs, methodology, etc.) at IRP@CenterPointEnergy.com following the meeting. Additional questions can also be sent to this e-mail address. **We appreciate written feedback within 10 days of the stakeholder meeting.**
9. The Teams meeting will be recorded only to ensure that we have accurately captured notes and questions from the meeting. The public meetings are not transcribed, and the recordings will not be posted to the website. However, Q&A summaries of our public meetings will be posted on www.CenterPointEnergy.com/irp.

Commitments for 2022/2023 IRP

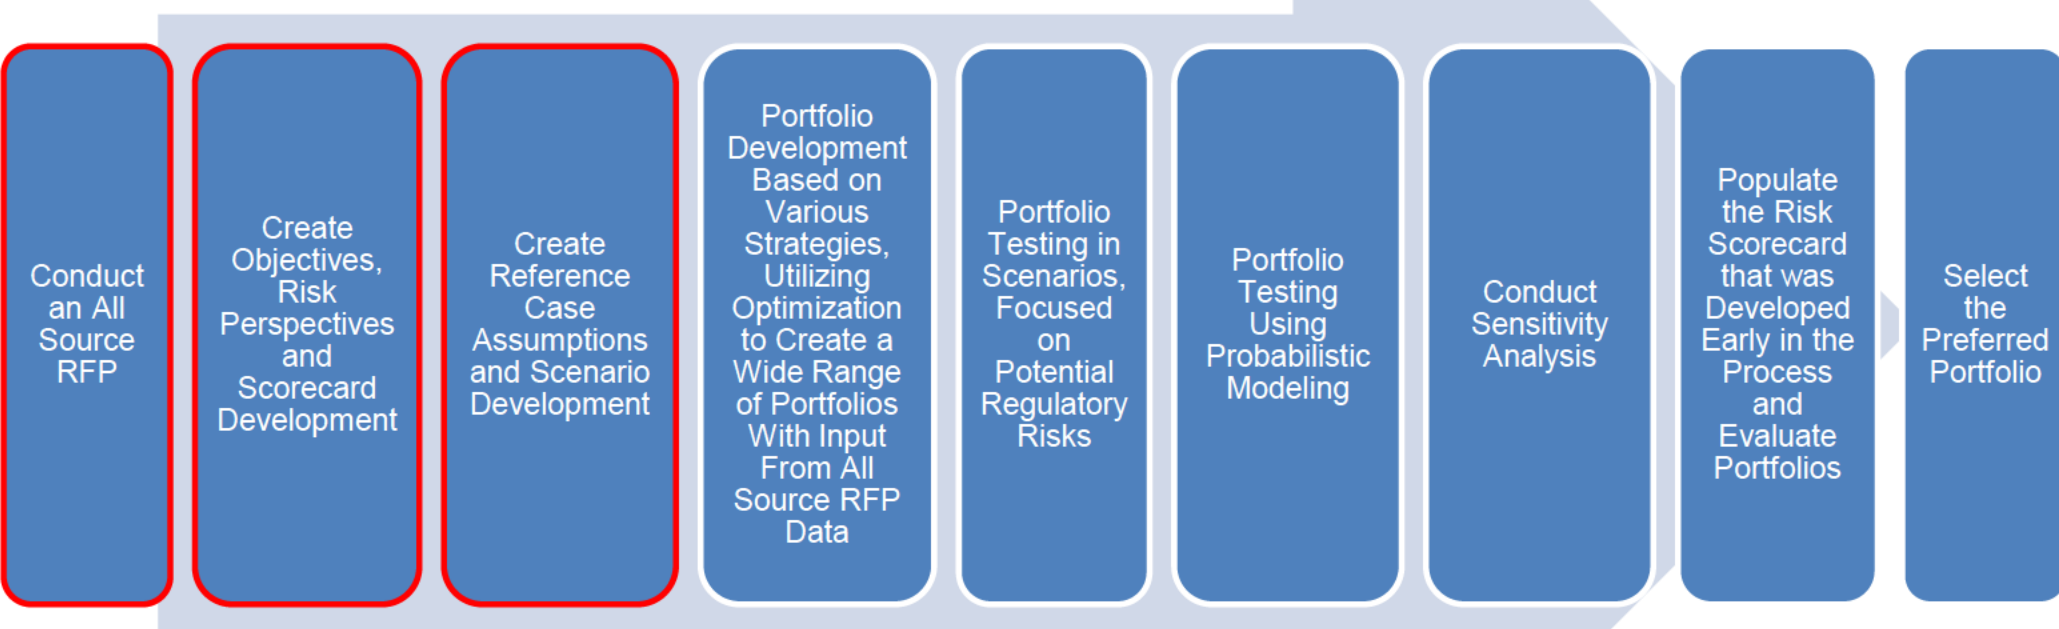

- ✓ Utilize an All-Source RFP to gather market pricing & availability data
- ✓ Utilize EnCompass software to improve visibility of model inputs and outputs
- ✓ Will include a balanced risk score card. Draft to be shared at the first public stakeholder meeting
- Will strive to make every encounter meaningful for stakeholders and for us
- The IRP process informs the selection of the preferred portfolio
- Work with stakeholders on portfolio development
- Will test a wide range of portfolios in scenario modeling and ultimately in the risk analysis
- Will conduct a sensitivity analysis
- Will conduct technical meetings with interested stakeholders who sign an NDA
- Evaluate options for existing resources
- The IRP will include information presented for multiple audiences (technical and non-technical)
- Will provide modeling data to stakeholders as soon as possible
 - Draft Reference Case results – October 4th to October 31st
 - Draft Scenario results – December 6th to December 20th
 - Full set of final modeling results - March 7th to March 31st

Proposed 2022/2023 IRP Process

Stakeholder input is provided on a timely basis throughout the process, with meetings held in August, October, December, and March

2022/2023 Stakeholder Process

August 18, 2022

- 2022/2023 IRP Process
- Objectives and Measures
- Encompass Software
- All-Source RFP
- MISO Update
- Environmental Update
- Draft Reference Case Market Inputs & Scenarios
- Load Forecast Methodology
- DSM MPS/ Modeling Inputs
- Resource Options

October 11, 2022

- All-Source RFP Results and Final Modeling Inputs
- Draft Resource Inputs
- Final Load Forecast
- Scenario Modeling Inputs
- Portfolio Development
- Probabilistic Modeling Approach and Assumptions
- Draft Reference Case Modeling Results¹

December 13, 2022

- Draft Scenario Optimization Results
- Draft Portfolios
- Final Scorecard and Risk Analysis
- Final Resource Inputs

March 14, 2023

- Final Reference Case Modeling
- Probabilistic Modeling Results
- Risk Analysis Results
- Preview the Preferred Portfolio

¹ Draft modeling results will be shared on a CenterPoint Energy Technical modeling call on October 31, 2022 and supplemental slides will be posted to www.centerpointenergy.com/irp.

CEI South Expects Capacity Value to Remain High, Based on Recent MISO Communications

- Aggressive decarbonization strategies and accelerated policies are driving rapid change in our region
- As the evolution of the resource fleet accelerates, variability is increasing, and attributes required to reliably operate the system are diminishing
- Increased complexity is leading to an expanded scope and reprioritization across the elements of MISO's Reliability Imperative
- [MISO] must develop a coordinated transition plan to reliably navigate from the present to the future

A survey of member plans indicates accredited capacity will continue to decline, combined with increasing intermittent resources and demand

4 *Future projections calculated as change from Future 1 2022 load assumption
Estimated accredited capacity: 16.6% for wind; 35% for solar, 87.5% for battery, 90% for coal, 90% for gas, and 95% for nuclear

CTs Provide the Priority System Attributes MISO is Seeking

The region's energy landscape is evolving and will continue to evolve toward a more complex, less predictable future

- Primarily weather-dependent resources
- Risk-adjusted reserve margin requirements
- Less predictable resource outages or unavailability
- Less predictable weather
- Increasing scarcity of essential reliability attributes
- Increasing electric load
- Increasing importance of accurate load and renewable forecasting
- Focus on providing energy for the worst week in each season

Maintaining reliability with the changing resource portfolio and evolving risks also increases the importance of ensuring adequate attributes

Stakeholder Feedback - Resources

| Request | Response |
|--|--|
| <p>Re-evaluate the CT's (combustion turbines) selected in the preferred portfolio of the 2019/2020 IRP</p> | <p>The CTs are the best resource available to ensure the reliability of the CenterPoint system, and the IURC approved their construction for that reason. CenterPoint will move forward with their construction to ensure its system remains reliable during the transition to renewables. Re-evaluating the CTs in this IRP would be a poor use of resources that CenterPoint believes could be better redirected to most efficiently perform the IRP</p> |
| <p>Allow the IRP to determine if Culley 2 retires in 2023 vs 2025</p> | <p>Culley 2 extension is contingent on IDEM NPDES approval. The capacity value Culley 2 is approximately \$8 million at MISO Cost of New Entry (CONE). The unit is not expected to run much but helps CEIS to meet its MISO capacity obligation while new solar projects and CTs are brought online</p> |

Stakeholder Feedback - Resources cont.

| Stakeholder Request | Response |
|---|---|
| Allow RFP respondents to update their proposals to account for the Inflation Reduction Act (IRA) | RFP respondents were given the opportunity to update their bids (updated results will be incorporated into the IRP) |
| Recommend that tax credits outlined in the Inflation Reduction Act are reflected in modeling assumptions | Updated RFP responses will be used to inform IRP assumptions |
| The MISO capacity price forecast only averages two vendors that converge over the planning period. Suggest scenario analysis rather than averaging the two forecasts so capacity price doesn't influence the resource build | Capacity prices are expected to remain high. During the portfolio development and capacity expansion phases of the modeling, the model will not allow revenues for excess capacity sales. |
| Provide stakeholders with access to RFP bid information | RFP bids will be shared using a process similar to past RFPs (requires NDA) |
| Provide a better understanding of how ACE proxy will be included | BAU Culley 3 assumes about \$30M in efficiency upgrades. Based on efficiency studies conducted for the 2019/2020 IRP |

Stakeholder Feedback - Resources cont.

| Stakeholder Request | Response |
|---|--|
| Incorporate MISO's seasonal construct into the modeling analysis | The seasonal construct will be the basis for resource adequacy requirements, including seasonal accreditation for resources and seasonal planning reserve margin requirement |
| Consider the resource screening analysis to determine if some thermal options (supercritical and ultra-supercritical coal) should be removed as resource options to the model | CenterPoint will consider pending additional feedback from other stakeholders and model runtime. Screening may include more than coal resources |
| Consider modeling longer duration lithium ion (longer than 4 hours) | The tech assessment includes a long duration storage option. Also, the model will have the ability to select multiple blocks of 4-hour lithium-ion storage. There are limited economies of scale associated with moving from 4-hour to longer duration lithium-ion |

Stakeholder Feedback - Resources cont.

Stakeholder Request

Response

Provide a better understanding of how ACE proxy will be included

BAU Culley 3 assumes about \$30M in efficiency upgrades. Based on efficiency studies conducted for the 2019/2020 IRP

Stakeholder Feedback - Score Card

| Stakeholder Request | Response |
|---|---|
| Use cumulative CO ₂ equivalent emissions as a measure of environmental sustainability | CO ₂ equivalent (stack emissions) will be added to the scorecard along with CO ₂ intensity |
| Include a metric on the scorecard that quantifies whether resources in each portfolio are located in low-income or communities of color | New generation resources in the IRP analysis are not typically location specific; This is outside the scope of the IRP analysis |
| Add a fuel cost risk measure and objective to the scorecard | Cost Risk will be included in the scorecard, including both fuel risk and 95% percentile cost risk |

Stakeholder Feedback - Score Card cont.

Request

Add a metric to the scorecard that looks at the cost burden by census tract and could account for the bill impacts of community solar projects that could be placed in those communities

Response

The IRP does consider energy cost by evaluating PVRR and fuel cost risk. Project location is generally outside the scope of the IRP analysis but is considered during project selection during which site-specific benefits are vetted. While outside the scope of the IRP, community solar should be compared with other potential assistance programs to determine which is more effective for providing bill assistance to low-income customers. Note that RFP responses did not include any community solar bids

Updated IRP Draft Objectives & Measures

Updates from the last meeting are shown in red

| Objective | Potential Measures | Unit |
|------------------------------|--|--|
| Affordability | 20 Year NPVRR | \$ |
| Cost Risk | Proportion of Energy Generated by Resources With Exposure to Coal and Gas Markets and Market Purchases | % |
| | 95% Value of NPVRR | \$ |
| Environmental Sustainability | CO ₂ Intensity CO ₂ Equivalent Emissions (Stack Emissions) | Tons CO ₂ e/kwh Tons CO ₂ e |
| Reliability | Must Meet MISO Planning Reserve Margin Requirement in All Seasons | UCAP MWs |
| | Spinning Reserve\Fast Start Capability | % of Portfolio MW's That Offer Spinning Reserve\Fast Start |
| Market Risk Minimization | Energy Market Purchases or Sales | % |
| | Capacity Market Purchases or Sales | % |
| Execution | Assess Challenges of Implementing Each Portfolio | Qualitative |

Stakeholder Feedback - DSM

| Request | Response |
|---|---|
| <p>In the high regulatory scenario EE costs shouldn't increase but should be equal to the reference case or go down and additional EE should be available to select</p> | <p>A high regulatory scenario in which either codes & standards or carbon prices increase, this erodes away savings and increases the acquisition costs of energy efficiency savings. Decarbonization / Electrification scenario will potentially capture high-cost EE bins</p> |
| <p>Several questions regarding MPS and DSM</p> | <p>Will be addressed in separate meetings with CAC</p> |
| <p>Incorporate more than proposed 10-20 MWs of Industrial DR</p> | <p>CEI South will include 25 MWs of industrial DR as a resource. Currently, CEI South does not have any industrial DR customers.</p> |

Stakeholder Feedback - DSM cont.

| Request | Response |
|---|--|
| MPS was inconsistent with the IRP in that the avoided cost of carbon regulation was not included which results in lower savings | Although including carbon cost in cost-effectiveness test may increase the savings potential, Indiana only recognizes the TRC (Total Resource Cost) as the cost-effectiveness test to implement non-low-income programs. |
| CenterPoint has not made available MPS & IRP modeling files | All modeling files were provided after incorporating feedback from CAC on 9/23/22 |
| CenterPoint should include EE bundles that included an “enhanced RAP” | CenterPoint has now included an “enhanced RAP” for commercial |

Stakeholder Feedback - DSM cont.

| Request | Response |
|---|--|
| CenterPoint should adjust inflation for low-income bundles to allow this non-selectable bundle to include higher short-term inflation rates | CenterPoint has made this adjustment |
| CenterPoint should include more emerging technology in MPS similar to Consumers Energy | CenterPoint MPS does include emerging technology and will also leverage flex funding to capture emerging technology in future action plans |
| CenterPoint should include demand response using the same methodology as AES | CenterPoint has adopted the AES methodology and DR is now aligned with peers to incorporate indicative TOU pilots |
| Implement residential rate programs (critical peak piecing, TOU, etc.) soon | Plan to evaluate in the future through a pilot |

Stakeholder Feedback - Inputs

| Stakeholder Request | Response |
|--|---|
| Several questions regarding load forecast | Will be addressed later in this presentation |
| Provide data inputs and modeling files to stakeholders | CenterPoint is targeting to provide modeling information according to the schedule outlined in the first stakeholder meeting |
| Stakeholder concern that the reference case forecasts for natural gas and coal prices are underestimating the cost of these fuels and their potential volatility | The stochastic analysis will vary coal and natural gas prices to capture potential volatility |
| The reference case forecasts for coal and natural gas prices show a decline in the near term | These assumptions will be updated as new forecasts are available. Included in appendix |
| Recommendation to utilize Henry Hub futures in the near term to better align with current market conditions | CenterPoint is considering using NYMEX futures in the near term and will adjust long-term forecasts as available. See appendix for forecast schedule and NYMEX. |

Stakeholder Feedback - Inputs cont.

| Stakeholder Request | Response |
|---|---|
| In future meetings discuss resource constraints applied to the EnCompass model and ELCC curves for renewables and battery storage resources | Development of ELCC curves will be discussed in this meeting along with constraints |
| Coal prices should be higher than the reference case in the high regulatory scenario (not the same as the reference case) | Coal prices will be updated to be higher than reference case in the high regulatory scenario |
| Stakeholder concern that sustained high fuel costs are possible but the reference case does not take this into consideration | This will be captured in the scenario analysis. The Continued High Inflation & Supply Chain Issues scenario includes a coal and natural gas price forecast higher than the reference case |

Stakeholder Feedback - Analysis

| Stakeholder Request | Response |
|--|---|
| Several questions were asked around stochastic modeling | Will be discussed later in today's presentation |
| Implement distribution system planning (FERC Order 2222) into IRP modeling | CenterPoint continues to monitor the level of distributed resources on its distribution system. The current level of penetration does not warrant this level of detailed analysis at this time but could be evaluated in a future IRP analysis. Additionally, MISO is currently planning to incorporate FERC Order 2222 into its processes in 2030 pending FERC approval. As more information becomes available from MISO it can help shape how this analysis should be performed |

Q&A

All-Source RFP Update

Drew Burczyk

Consultant, Resource Planning & Market Assessments

1898 & Co.

- The Inflation Reduction Act was signed into law August 16th.
- Stakeholder Meeting 1 occurred August 18th.
- Agreed with feedback and comments made during the Stakeholder meeting that updated costs from IRA could impact IRP modeling.
- August 23rd reached back out to bidders asking for updated pricing.
- This has delayed draft modeling results; A technical call to discuss draft results has been scheduled for October 31st with those that have signed a NDA. Supplemental slides will be posted to the www.CenterPointEnergy.com/irp

- 9 of 27 bidders submitted updated pricing to account for IRA changes.
- 77 Bids were returned with updated pricing.
 - 22 Solar bids
 - 46 Storage bids
 - 4 Wind bids
 - 5 Solar + Storage bids
- Example reasoning from bidders who did not update pricing:
 - Not applicable to proposal technology
 - Proposal pricing remains the same, offer was a BTA, tax credit would be monetized by CenterPoint
 - Benefits of IRA are offset by inflation and shortage in labor market

Pre vs Post IRA Pricing

Wide range of changes within certain technology groups. At a high level, the updated pricing received is not a 1:1 equivalent of IRA tax credit qualification.

Purchase prices do not account for tax benefits

Q&A

Draft Resource Inputs

Kyle Combes

Project Manager, Resource Planning & Market Assessments

1898 & Co.

- MISO is moving to a seasonal resource adequacy construct.
 - Winter - December, January, February
 - Spring - March, April, May
 - Summer - June, July, August
 - Fall - September, October, November
- Implementation beginning in MISO Planning Year 2023/24.
- This is new, and dynamic, we are working through these impacts and changes as more information becomes available.

MISO Installed Renewable Capacity

Draft Projected Seasonal Accreditation

Generation Transition Timeline

Bags = Broadway Avenue Gas Turbines
 BTA = Build Transfer Agreement/Utility Ownership
 ELG = Effluent Limitations Guidelines
 MW = Megawatt
 PPA = Power Purchase Agreement
 IRP = Integrated Resource Plan

Balance of Loads and Existing & Planned Resources Summer

Balance of Loads and Existing & Planned Resources Fall

Balance of Loads and Existing & Planned Resources Winter

Balance of Loads and Existing & Planned Resources Spring

- RFP bids were used to inform cost assumptions for near term resources.
- Technology Assessment was developed for future generation options.
- The costs from the Technology Assessment in combination with cost curve estimates are used for modeling resources out beyond the period where we have RFP bid data available.
- If no bid was received for a resource, TA costs are used as the default.

Examples of candidates for natural gas peaking generation:

| Peaking | F-Class SCGT | G/H-Class SCGT | J-Class SCGT | 6 x 9 MW Recip Engines | 6 x 18 MW Recip Engines |
|----------------------------------|--------------|----------------|--------------|------------------------|-------------------------|
| Capacity (MW) | 238 | 295 | 384 | 54 | 110 |
| Fixed O&M (2022 \$/kW-Yr) | \$8 | \$7 | \$5 | \$28 | \$18 |
| Total Project Costs (2022 \$/kW) | \$712 | \$699 | \$569 | \$1,756 | \$1,561 |

Examples of candidates for natural gas combined cycle generation:

| Combined Cycle - Unfired | 1x1 F-Class ¹ | 1x1 G/H-Class ¹ | 1x1 J-Class ¹ |
|----------------------------------|--------------------------|----------------------------|--------------------------|
| Capacity (MW) | 363 | 431 | 551 |
| Fixed O&M (2022 \$/kW-Yr) | \$12 | \$11 | \$8 |
| Total Project Costs (2022 \$/kW) | \$1,278 | \$1,162 | \$962 |

| Combined Cycle - Fired | 1x1 F-Class ¹ | 1x1 G/H-Class ¹ | 2x1 J-Class ¹ |
|----------------------------------|--------------------------|----------------------------|--------------------------|
| Capacity (MW) | 419 | 508 | 1,307 |
| Fixed O&M (2022 \$/kW-Yr) | \$11 | \$9 | \$4 |
| Total Project Costs (2022 \$/kW) | \$1,146 | \$1,036 | \$641 |

¹ 1x1 Combined Cycle Plant is one combustion turbine with heat recovery steam generator and one steam turbine utilizing the unused exhaust heat. 2x1 is two combustion turbines and 1 steam turbine.

Examples of candidate for nuclear generation:

| Nuclear | Small Modular Reactor |
|----------------------------------|-----------------------|
| Size (MW) | TBD |
| Fixed O&M (2022 \$/kW-Yr) | TBD |
| Total Project Costs (2022 \$/kW) | TBD |

Examples of candidate for coal fired generation:

| Coal | Supercritical Pulverized Coal with 90% Carbon Capture | Ultra-Supercritical Pulverized Coal with 90% Carbon Capture |
|----------------------------------|---|---|
| Size (MW) | 506 | 747 |
| Fixed O&M (2022 \$MM/kW-Yr) | \$32 | \$32 |
| Total Project Costs (2022 \$/kW) | \$6,659 | \$6,024 |

Examples of other thermal:

| Other Thermal | Co-Gen Steam Turbine | 2x1 F-Class CCGT Conversion | FB Culley 2 Gas Conversion | FB Culley 3 Gas Conversion |
|----------------------------------|----------------------|-----------------------------|----------------------------|----------------------------|
| Size (MW) | 22 | 717 / 257 incremental | 100 / 0 incremental | 287 / 0 incremental |
| Fixed O&M (2022 \$/kW-Yr) | \$323 | \$12 | TBD | TBD |
| Total Project Costs (2022 \$/kW) | \$2,832 | \$691 / \$1,990 | \$247 | \$107 |

Examples of candidate for wind generation:

| Wind | Indiana Wind Energy | Indiana Wind + Storage |
|----------------------------------|---------------------|---------------------------|
| Base Load Net Output | 200 MW | 50 MW + 10 MW / 40 MWh |
| Fixed O&M (2022 \$/kW-Yr) | \$48 | \$49 |
| Total Project Costs (2022 \$/kW) | \$1,845 | \$2,107 |

Examples of candidate for solar generation:

| Solar | Solar Photovoltaic | Solar Photovoltaic | Solar Photovoltaic | Solar PV + Storage |
|----------------------------------|--------------------|--------------------|--------------------|---------------------------|
| Base Load Net Output | 10 MW | 50 MW | 100 MW | 50 MW + 10 MW / 40 MWh |
| Fixed O&M (2022 \$/kW-Yr) | \$60 | \$16 | \$11 | \$19 |
| Total Project Costs (2022 \$/kW) | \$2,560 | \$1,856 | \$1,779 | \$1,910 |

Examples of storage:

| Storage | Lithium-Ion Battery Storage | Lithium-Ion Battery Storage | Lithium-Ion Battery Storage | Long Duration Storage |
|----------------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------|
| Base Load Net Output | 10 MW / 200 MWh | 50 MW / 200 MWh | 100 MW / 400 MWh | 300 MW / 3,000 MWh |
| Fixed O&M (2022 \$/kW-Yr) | \$40 | \$38 | \$35 | \$19 |
| Total Project Costs (2022 \$/kW) | \$2,500 | \$2,160 | \$2,020 | \$2,590 |

- Initial curve modeled from 2022 Annual Technology Baseline from NREL.
- Pricing of all RFP purchase options taken per technology type.
 - Pricing includes updates from the Inflation Reduction Act.
- Reference case follows the NREL curve shifted to match the aggregate bid pricing.
- The 'Low' curve is the interpolation from the reference case to the moderate NREL curve.

Capacity Cost Curves - Solar

Capacity Cost Curves - Storage

Capacity Cost Curves – Wind

Capacity Cost Curves – Combined Cycle

Q&A

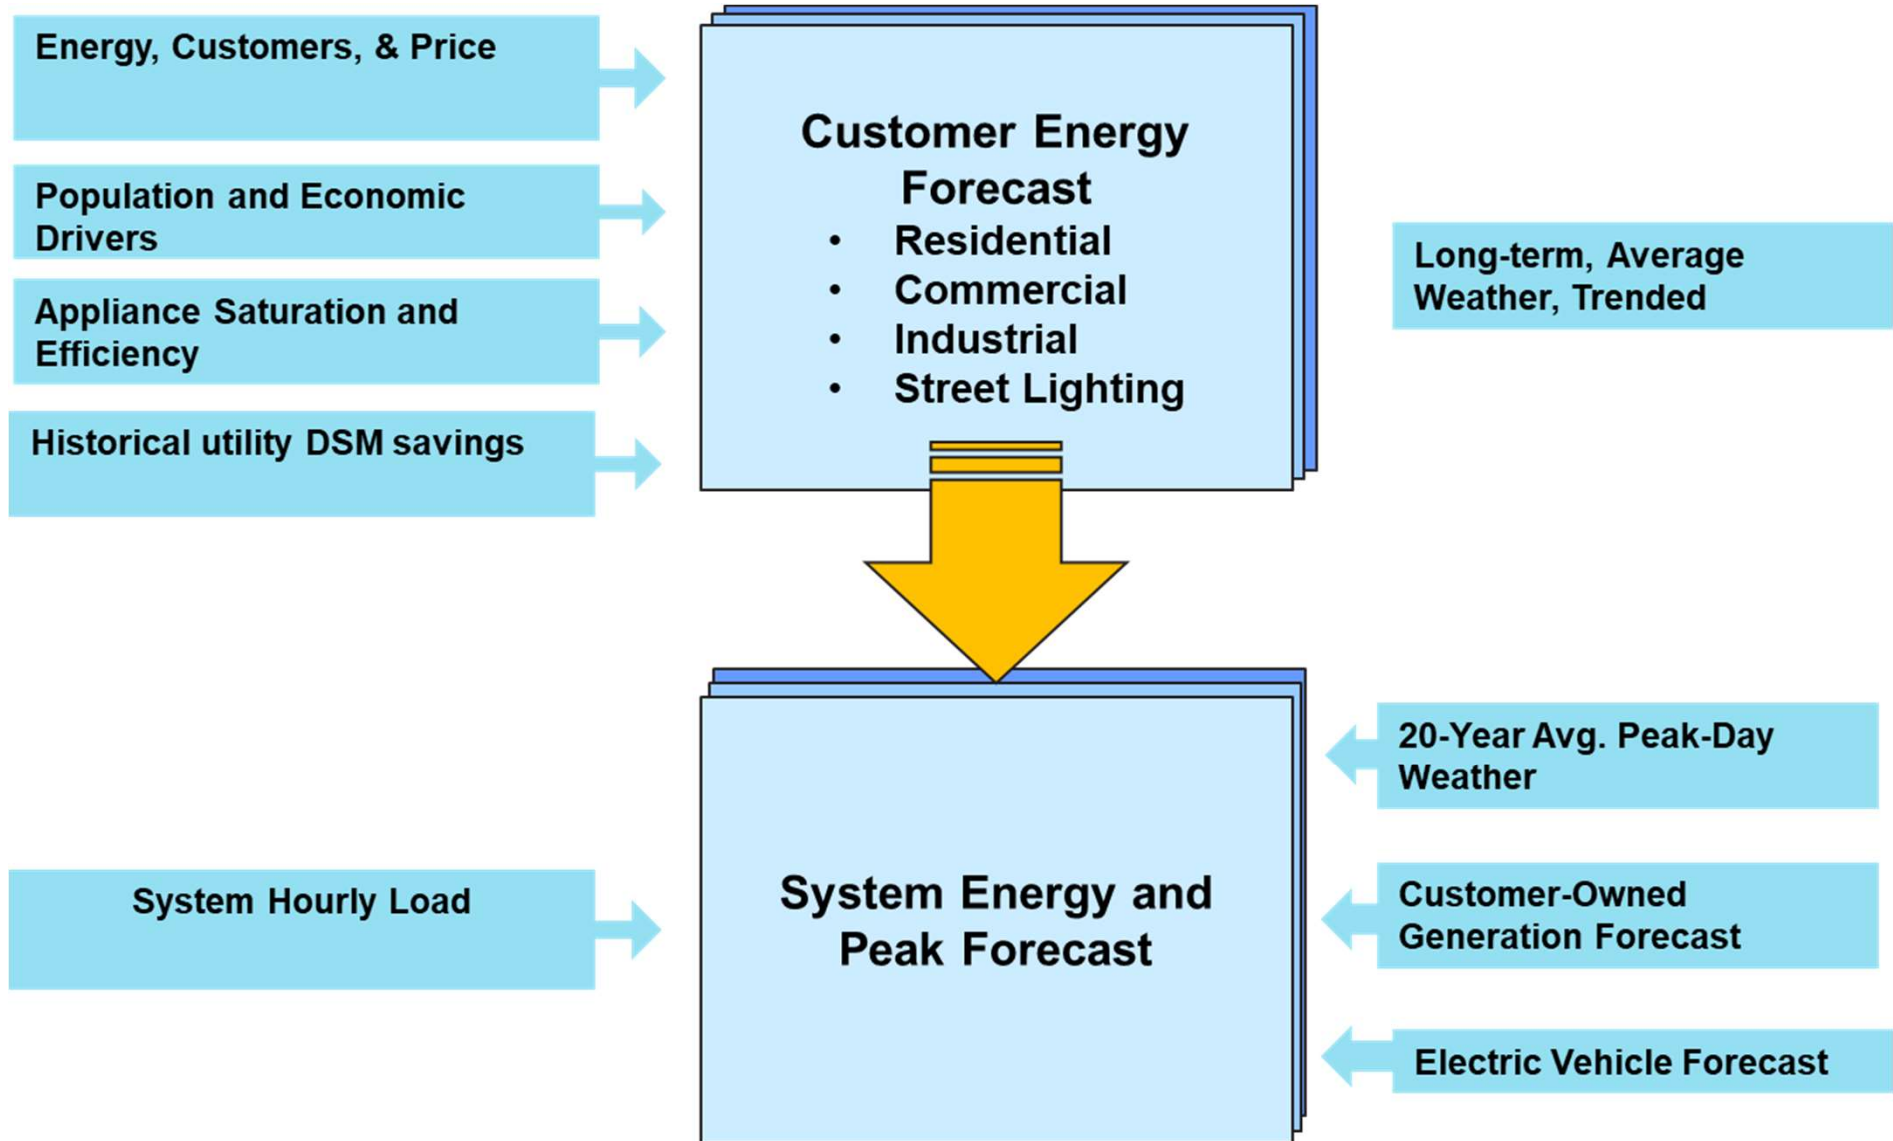

Final Load Forecast

Michael Russo
Senior Forecast Consultant - Itron

- Forecast excludes the impact of additional CenterPoint sponsored energy efficiency program savings
- Forecast includes the impact of customer owned photovoltaics and electric vehicles
- Average annual growth of 0.7% on energy and peaks, over the 2022-2042 forecast period
 - Includes the addition of a large industrial customer in 2024
 - Excluding this addition, average annual growth would be 0.3% on energy and 0.4% on peaks.

Baseline Bottom-Up Forecast Approach

- Models estimated using rate class billed sales and customer data
- Monthly models, estimated for the period January 2011 to June 2022
- Rate class models:
 - Residential average use
 - Residential customers
 - Commercial total sales
 - Industrial total sales
 - Street lighting total sales (estimated from January 2014)
 - System peak

Residential Average Use model

Residential Forecast Drivers

- Residential intensities based on the 2022 Annual Energy Outlook from the Energy Information Administration (EIA)
 - Reflects changes in end-use ownership, efficiency trends, and home thermal shell efficiency
 - Calibrated to CenterPoint's service territory using end-use saturations from 2016 study

- Economic drivers from IHS Markit for Evansville MSA

Residential Class Forecast

- Does not include the impact of future CenterPoint efficiency program savings
- Flattening of federal efficiency improvements results in average use growth over the forecast period

Commercial & Industrial Class Forecast Driver

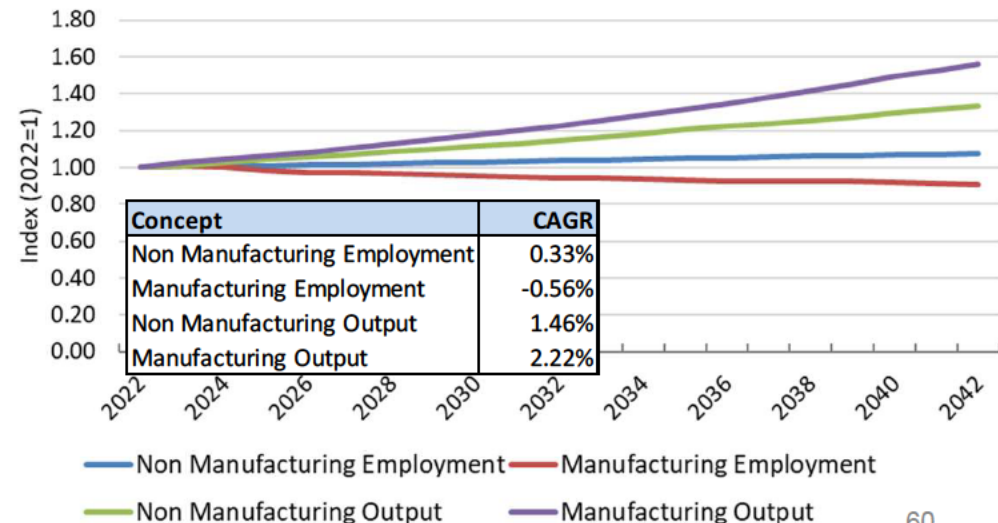

Commercial Energy Intensities

- Commercial intensities based on the 2022 Annual Energy Outlook from the Energy Information Administration (EIA)
 - Reflects efficiency trends and square footage estimates by building type and end-use
 - Calibrated to CenterPoint's annual commercial sales

- Economic drivers from IHS Markit for Evansville MSA and Indiana

Commercial & Industrial Economic Drivers

Commercial & Industrial Class Forecast

- Does not include the impact of future CenterPoint efficiency program savings
- Strong continued federal efficiency gains in commercial buildings, driven by lighting and ventilation
- Large new industrial customer will be added in 2024

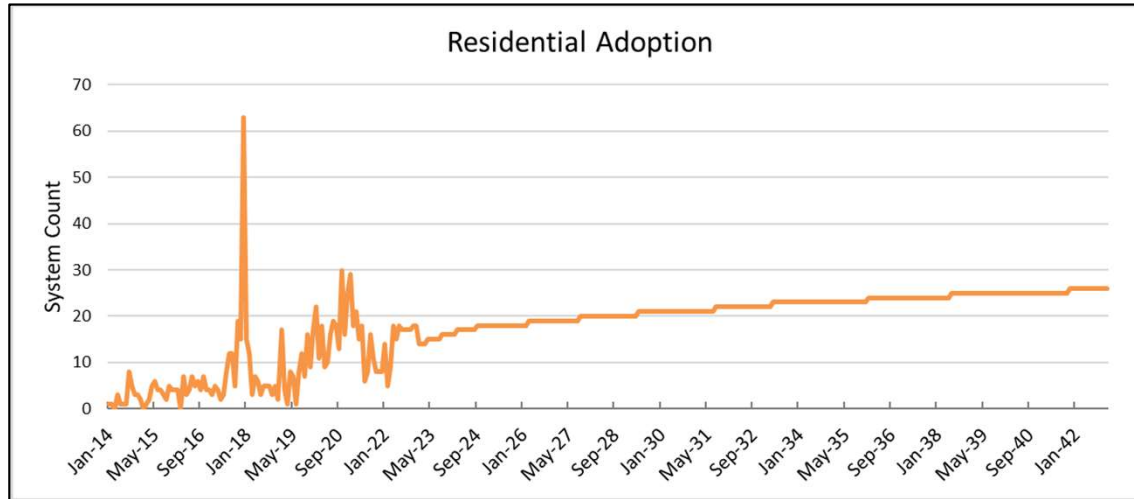

Customer Owned Photovoltaics: Customer Economics

- Monthly adoption modeled as a function of simple payback
 - Incorporates declining solar system costs, electric price projections, changes in net metering laws, and federal incentives
 - Switch from net metering to Excess Distributed Generation (EDG)
 - Continuation of ITC under the Inflation Reduction Act (IRA)
 - Continued decline in solar costs

Customer Owned Photovoltaics: Forecast

- Commercial adoption based on historical relationship between residential and commercial installations.

- Total installed capacity derived by combining monthly adoptions with average (kW) system size
- NREL PVWatts hourly solar profile is used to calculate monthly load factors and estimate monthly solar generation
- The load forecast is only adjusted for incremental new solar capacity

Electric Vehicle Forecast:

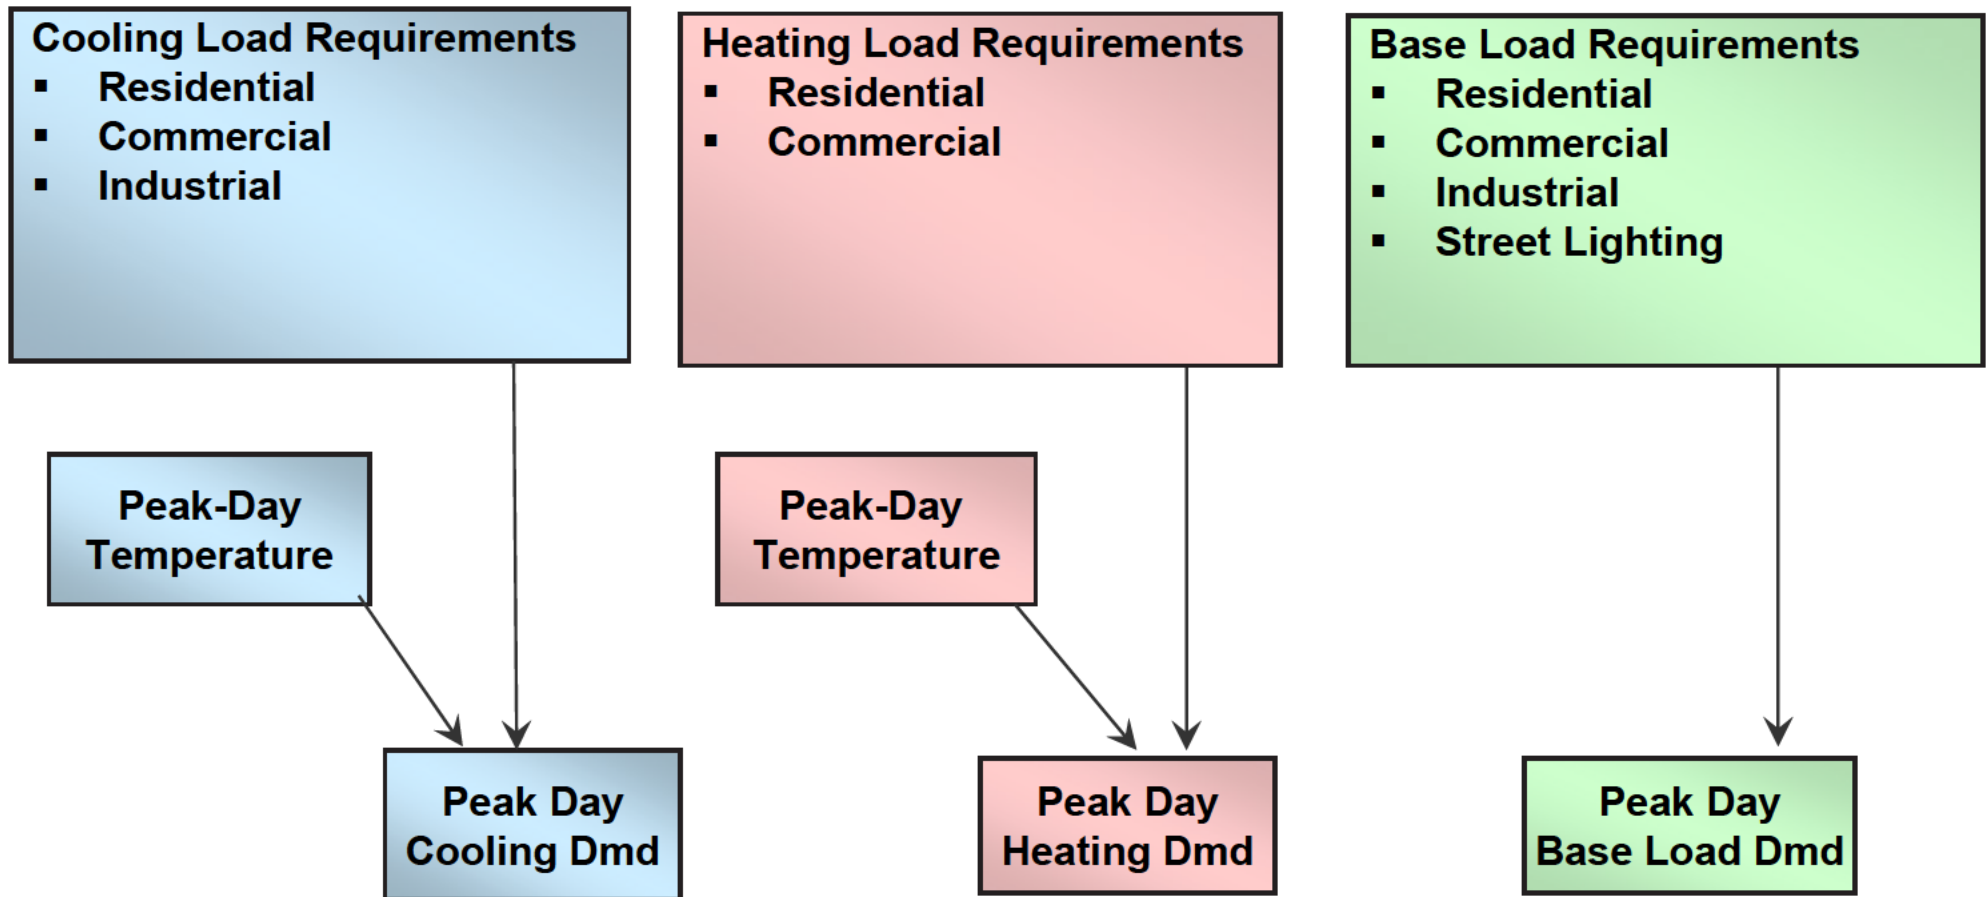

- There are approximately 700 electric vehicles currently registered in CenterPoint's service territory.
 - This is below the implied number of electric vehicles based on U.S. average electric vehicle share which would be approximately 2,200 electric vehicles.
- The forecast is based on the average of the Energy Information Administration and BloombergNEF forecasts
- The forecast is calibrated into the number of electric vehicles in CenterPoint's territory
- Incorporates assumptions regarding vehicles per household and miles traveled per year

Peak Demand Model Forecast

- Peak demand is driven by heating, cooling, and base load requirements derived from the customer class forecasts

Combine Energy and Hourly Profiles

Hourly Shapes: Impact on Peak

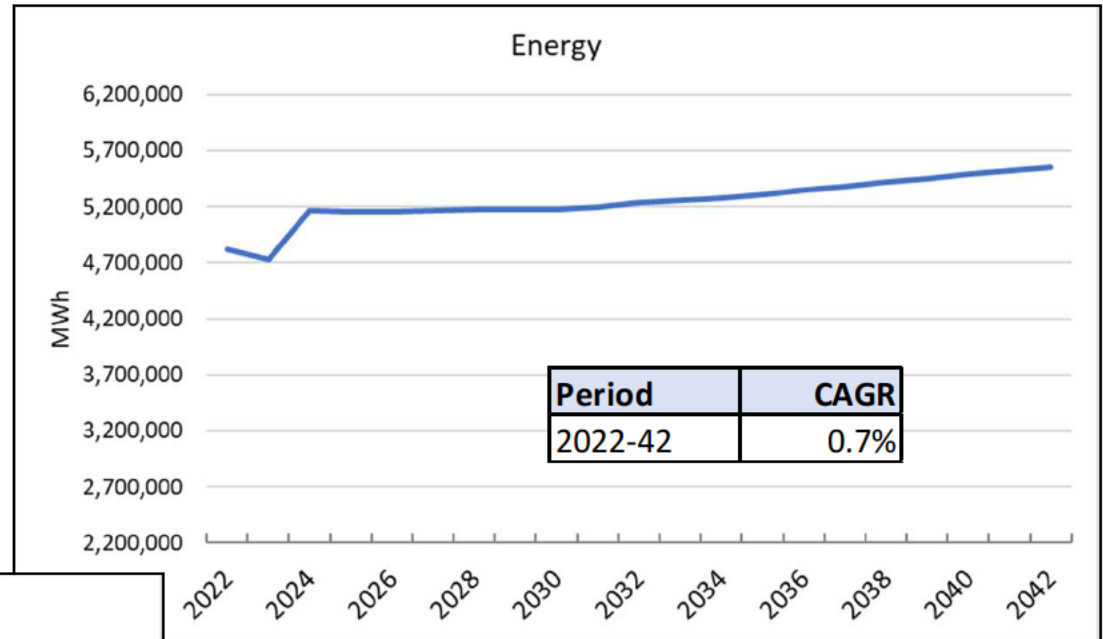

- PV and EV adoption will reshape system load over time
- Timing and level of peak impacted by change in system hourly load profile

Energy and Peak Forecast

- Does not include the impact of future CenterPoint efficiency program savings
- Includes the impact of photovoltaics and electric vehicles

- **High Regulatory**= Lower load forecast driven by lower economic forecast
- **Market Driven Innovation**= Higher load forecast driven by higher economic forecast
- **Decarbonization\Electrification**= Higher load driven by increased adoption of electric water heaters, clothes dryers, and heat-pump heaters. Higher electric vehicle and solar forecast.
- **High Inflation & Supply Chain Issue**= Lower load forecast driven by lower economic forecast, lower electric vehicles and solar forecasts.

Scenario Peak Load Forecast

Q&A

Scenario and Probabilistic Modeling Approach and Assumptions

Brian Despard

*Project Manager, Resource Planning & Market Assessments
1898 & Co.*

Objective: Utilize stochastic analysis around key IRP inputs to measure uncertainty around power supply portfolio costs.

Two Purposes:

1. Evaluate results of stochastic inputs analysis to inform on what inputs to use for various scenarios; and
2. Stochastically develop 200 “families” of correlated inputs to run through PCM – result will be probability distribution around power supply costs.

- Peak Demand
- Natural Gas (NG) Prices
- Coal Prices
- CO₂ Costs
- Renewable Development Costs

1. Develop uncertainty variable parameters by month – expected value, volatility, correlations
2. Input variables into Monte Carlo simulation model
3. Run simulations with uncertainty variables being the output
4. Evaluate output implied distributions for each variable
5. Identify 200 sets of uncertainty variable “families”

Stochastics Process Overview

Variable Mean & STDEV

Correlations

Monte Carlo Simulation
200 Iterations

Variable Outputs (yarn charts)

200 families of inputs where each iteration (family) reflects variable levels and paths that are tied together by correlations

Uncertainty Variable Parameters Expected Values & Volatilities

Expected values (mean values): Reference Case forecasts for each variable

Volatilities (standard deviations):

- **Demand:** From various Itron demand scenarios
- **Natural gas pricing:** From ABB forecast Base/High/Low forecast
- **Coal pricing:** From variation in consensus forecasts
- **CO₂ Costs:** Reference case of zero and 2 high cases
- **Newbuild CAPEX:** NREL ATB range of costs

Uncertainty Variable Parameters Expected Correlations

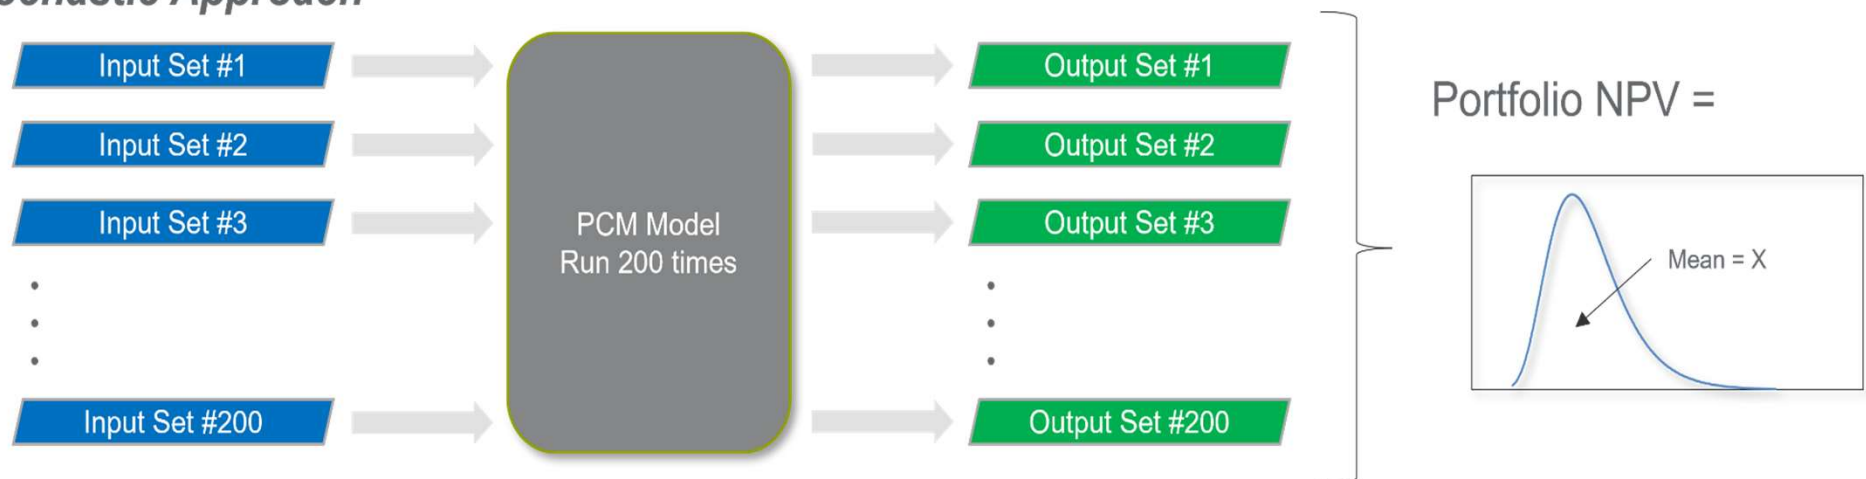

| Variable | Demand | NG Price | Coal Price | CO ₂ Cost | Dev CAPEX |
|----------------------|-------------------|-------------------------------|-------------------------------|----------------------|-----------|
| Demand | | Slightly Positive | Zero | Zero | Zero |
| NG Price | Slightly Positive | | Slightly Negative Negative | Negative | Positive |
| Coal Price | Zero | Slightly Negative Negative | | Negative | Zero |
| CO ₂ Cost | Zero | Negative | Negative | | Positive |
| Dev CAPEX | Zero | Positive | Zero | Positive | |

Production Cost Modeling Stochastics Process Overview

Typical Deterministic Approach

Stochastic Approach

Scenario Inputs: Natural Gas Henry Hub (\$/MMBtu)

| Year | Reference Case | High Regulatory | Market Driven Innovation | Decarbonization/Electrification | Continued High Inflation & Supply Chain Issues |
|------|----------------|-----------------|--------------------------|---------------------------------|--|
| 2022 | \$5.08 | \$5.08 | \$5.08 | \$5.08 | \$5.08 |
| 2023 | \$4.36 | \$4.36 | \$4.36 | \$4.36 | \$4.36 |
| 2024 | \$3.89 | \$3.89 | \$3.89 | \$3.89 | \$3.89 |
| 2025 | \$3.90 | \$4.78 | \$3.68 | \$4.30 | \$4.30 |
| 2026 | \$4.02 | \$5.68 | \$3.47 | \$4.72 | \$4.72 |
| 2027 | \$4.16 | \$6.58 | \$3.27 | \$5.14 | \$5.14 |
| 2028 | \$4.31 | \$7.48 | \$3.06 | \$5.55 | \$5.55 |
| 2029 | \$4.47 | \$7.85 | \$3.14 | \$5.79 | \$5.79 |
| 2030 | \$4.58 | \$8.25 | \$3.16 | \$5.99 | \$5.99 |
| 2031 | \$4.71 | \$8.70 | \$3.18 | \$6.22 | \$6.22 |
| 2032 | \$4.83 | \$8.95 | \$3.26 | \$6.39 | \$6.39 |
| 2033 | \$4.94 | \$9.23 | \$3.32 | \$6.56 | \$6.56 |
| 2034 | \$5.05 | \$9.64 | \$3.32 | \$6.76 | \$6.76 |
| 2035 | \$5.29 | \$10.07 | \$3.49 | \$7.07 | \$7.07 |
| 2036 | \$5.49 | \$10.63 | \$3.57 | \$7.39 | \$7.39 |
| 2037 | \$5.70 | \$11.22 | \$3.66 | \$7.73 | \$7.73 |
| 2038 | \$5.89 | \$11.68 | \$3.76 | \$8.01 | \$8.01 |
| 2039 | \$6.17 | \$12.49 | \$3.87 | \$8.45 | \$8.45 |
| 2040 | \$6.42 | \$13.06 | \$4.00 | \$8.81 | \$8.81 |
| 2041 | \$6.63 | \$13.81 | \$4.05 | \$9.18 | \$9.18 |
| 2042 | \$6.81 | \$14.23 | \$4.15 | \$9.44 | \$9.44 |

Scenario Inputs: Coal Illinois Basin fob Mine (\$/MMBtu)

| Year | Reference Case | High Regulatory | Market Driven Innovation | Decarbonization/Electrification | Continued High Inflation & Supply Chain Issues |
|------|----------------|-----------------|--------------------------|---------------------------------|--|
| 2022 | \$3.48 | \$3.48 | \$3.48 | \$3.48 | \$3.48 |
| 2023 | \$2.89 | \$2.89 | \$2.89 | \$2.89 | \$2.89 |
| 2024 | \$2.26 | \$2.26 | \$2.26 | \$2.26 | \$2.26 |
| 2025 | \$2.23 | \$2.41 | \$2.17 | \$2.41 | \$2.41 |
| 2026 | \$2.31 | \$2.56 | \$2.09 | \$2.56 | \$2.56 |
| 2027 | \$2.32 | \$2.71 | \$2.00 | \$2.71 | \$2.71 |
| 2028 | \$2.39 | \$2.87 | \$1.91 | \$2.87 | \$2.87 |
| 2029 | \$2.44 | \$2.95 | \$1.94 | \$2.95 | \$2.95 |
| 2030 | \$2.46 | \$2.98 | \$1.93 | \$2.98 | \$2.98 |
| 2031 | \$2.52 | \$3.10 | \$1.94 | \$3.10 | \$3.10 |
| 2032 | \$2.56 | \$3.13 | \$1.98 | \$3.13 | \$3.13 |
| 2033 | \$2.63 | \$3.25 | \$2.01 | \$3.25 | \$3.25 |
| 2034 | \$2.70 | \$3.34 | \$2.04 | \$3.34 | \$3.34 |
| 2035 | \$2.75 | \$3.43 | \$2.06 | \$3.43 | \$3.43 |
| 2036 | \$2.75 | \$3.49 | \$2.00 | \$3.49 | \$3.49 |
| 2037 | \$2.83 | \$3.60 | \$2.05 | \$3.60 | \$3.60 |
| 2038 | \$2.90 | \$3.69 | \$2.10 | \$3.69 | \$3.69 |
| 2039 | \$2.98 | \$3.79 | \$2.18 | \$3.79 | \$3.79 |
| 2040 | \$3.23 | \$3.98 | \$2.48 | \$3.98 | \$3.98 |
| 2041 | \$3.14 | \$4.00 | \$2.29 | \$4.00 | \$4.00 |
| 2042 | \$3.39 | \$4.21 | \$2.58 | \$4.21 | \$4.21 |

Scenario Inputs: Peak Load

| Year | Reference Case | High Regulatory | Market Driven Innovation | Decarbonization/Electrification | Continued High Inflation & Supply Chain Issues |

IRP Portfolio Decisions

- FB Culley 2 & 3 conversion or retirement decision is a key part of this IRP.
- With MISO's shift to seasonal construct there is a capacity shortfall in 2024 prior to the CTs coming online and then in 2028 into the future.
- Will analyze a wide range of portfolios that provide insights around the FB Culley decision and the future resource mix.

- Business as Usual (Continue to run FB Culley 3 through 2042)
- Scenario Based Portfolios
 - Reference Case
 - High Regulatory
 - Market Driven Innovation
 - Decarbonization/Electrification
 - Continued High Inflation & Supply Chain Issues
- Replacement of FB Culley 2 & 3
 - Retire FB Culley 3 by 2030
 - Replace with non-thermal (Wind, Solar, Storage)
 - Replace with thermal (CCGT, CT)
 - Retire FB Culley 3 by 2034
 - Replace with non-thermal (Wind, Solar, Storage)
 - Replace with thermal (CCGT, CT)
 - FB Culley 2 or 3 gas conversion
 - FB Culley 2 & 3 gas conversion

Q&A

Draft Reference Case Modeling Results

Matt Lind

Director, Resource Planning & Market Assessments

1898 & Co.

- The incorporation of the IRA has delayed draft modeling results.
- A technical call has been scheduled for October 31st with those that have signed a NDA.
- Supplemental slides will be posted to the www.CenterPointEnergy.com/irp

Q&A

Appendix

Definitions

| Term | Definition |
|-----------------|---|
| ACE | Affordable Clean Energy (ACE) Rule, establishes emission guidelines for states to develop plans to address greenhouse gas emissions from existing coal-fired power plants |
| All-Source RFP | Request for proposals, regardless of source (renewable, thermal, storage, demand response) |
| BAGS | Broadway Avenue Gas Turbine |
| BTA | Build Transfer Agreement/Utility Ownership |
| C&I | Commercial and Industrial |
| CAA | Clean Air Act |
| CAGR | Compound Annual Growth Rate |
| Capacity | The maximum output of electricity that a generator can produce under ideal conditions (megawatts) |
| CCGT | A combined-cycle power plant uses both a gas and a steam turbine together to produce up to 50 percent more electricity from the same fuel than a traditional simple-cycle plant. The waste heat from the gas turbine is routed to the nearby steam turbine, which generates extra power |
| CCR Rule | Coal Combustion Residuals Rule |
| CCS | Carbon Capture and Storage |
| CDD | Cooling Degree Day |
| CEI South | CenterPoint Energy Indiana South |
| CO ₂ | Carbon dioxide |

Definitions Cont.

| Term | Definition |
|------------------------|---|
| CONE | Cost of New Entry |
| CPCN | A Certificate of Public Convenience and Necessity is required to be granted by the Commission for significant generation projects |
| CSAPR | Cross State Air Pollution Rule |
| DER | Distributed Energy Resource |
| Deterministic Modeling | Simulated dispatch of a portfolio in a determined future. Often computer generated portfolios are created by optimizing on cost to the customer |
| DLC | Direct Load Control |
| DR | Demand Response |
| DSM | Demand side management includes both Energy Efficiency and Demand Response programs to reduce customer demand for electricity |
| EE | Energy Efficiency |
| ELCC | Effective Load Carrying Capability |
| ELG | Effluent Limitation Guidelines are U.S. national standards for wastewater discharges to surface waters and publicly owned treatment works |
| EnCompass | Electric modeling forecasting and analysis software |
| Energy | Amount of electricity (megawatt-hours) produced over a specific time period |

Definitions Cont.

| Term | Definition |
|---------------------------|--|
| EPA | Environmental Protection Agency |
| FERC | Federal Energy Regulatory Commission |
| GW | Gigawatt (1,000 million watt), unit of electric power |
| GWh | Gigawatt Hour |
| HDD | Heating Degree Day |
| Henry Hub | Point of interconnection of interstate and intrastate natural gas pipelines as well as other related infrastructure in Erath, Louisiana |
| IDEM | Indiana Department of Environmental Management |
| Installed Capacity (ICAP) | Refers to generating capacity after ambient weather adjustments and before forced outages adjustments |
| Intermittent | An intermittent energy source is any source of energy that is not continuously available for conversion into electricity and outside direct control |
| IRP | Integrated Resource Plan is a comprehensive plan to meet customer load expectations |
| IURC | The Indiana Utility Regulatory Commission is the public utilities commission of the State of Indiana. The commission regulates electric, natural gas, telecommunications, steam, water and sewer utilities |
| KWh | Kilowatt Hour |

Definitions Cont.

| Term | Definition |
|----------------------------------|--|
| LCOE | Levelized Cost of Energy, A measure that looks at cost and energy production over the life of an asset so different resources can be compared. Does not account for capacity value. |
| LMR | Load Modifying Resource |
| Local Clearing Requirement (LCR) | Capacity needs to be fulfilled by local resource zone |
| LRZ6 | MISO Local Resource Zone 6 |
| MATS | Mercury and Air Toxics Standard |
| Mine Mouth | At the mine location |
| MISO | Midcontinent Independent System Operator, an Independent System Operator (ISO) and Regional Transmission Organization (RTO) providing open-access transmission service and monitoring the high-voltage transmission system in the Midwest United States and Manitoba, Canada and a southern United States region which includes much of Arkansas, Mississippi, and Louisiana. MISO also operates one of the world's largest real-time energy markets |
| MMBTU | Million British Thermal Units |
| MPS | Market potential study - Determines the total market size (value/volume) for a DSM at a given period of time |
| MSA | Metropolitan Statistical Area |
| MW | Megawatt (million watt), unit of electric power |
| NAAQS | National Ambient Air Quality Standards |

Definitions Cont.

| Term | Definition |
|--|---|
| Name Plate Capacity | The intended full-load sustained output of a generation facility |
| NDA | Non-Disclosure Agreement |
| NOI | Notice of Intent |
| NO _x | Nitrogen Oxides |
| NPDES | National Pollutant Discharge Elimination System |
| NPVRR | Net Present Value Revenue Requirement |
| NSPS | New Source Performance Standards |
| OMS | Organization of MISO States, was established to represent the collective interests of state and local utility regulators in the Midcontinent Independent System Operator (MISO) region and facilitate informed and efficient participation in related issues. |
| Peaking | Power plants that generally run only when there is a high demand, known as peak demand, for electricity |
| Planning Reserve Margin Requirement (PRMR) | Total capacity obligation each load serving entity needs to meet |
| Portfolio | A group of resources to meet customer load |
| PPA | Purchase Power Agreement |

Definitions Cont.

| Term | Definition |
|------------------------|---|
| Preferred Portfolio | The IRP rule requires that utilities select the portfolio that performs the best, with consideration for cost, risk, reliability, and sustainability |
| Probabilistic modeling | Simulate dispatch of portfolios for a number of randomly generated potential future states, capturing performance measures |
| PV | Photovoltaic |
| RA (Resource Adequacy) | RA is a regulatory construct developed to ensure that there will be sufficient resources available to serve electric demand under all but the most extreme conditions |
| RAP | Realistic Achievable Potential |
| Resource | Supply side (generation) or demand side (Energy Efficiency, Demand Response, Load Shifting programs) to meet planning reserve margin requirements |
| SAC | Seasonal Accredited Capacity |
| Scenario | Potential future State-of-the-World designed to test portfolio performance in key risk areas important to management and stakeholders alike |
| SDE | Spray Dryer Evaporator |
| Sensitivity Analysis | Analysis to determine what risk factors portfolios are most sensitive to |
| SIP | State Implementation Plan |
| Spinning Reserve | Generation that is online and can quickly respond to changes in system load |

Definitions Cont.

| Term | Definition |
|--------------------------|---|
| T&D | Transmission and Distribution |
| Technology Assessment | An analysis that provides overnight and all-in costs and technical specifications for generation and storage resources |
| Unforced Capacity (UCAP) | A unit's generating capacity adjusted down for forced outage rates (thermal resources) or expected output during peak load (intermittent resources) |
| VAR Support | Unit by which reactive power is expressed in an AC electric power system |
| ZLD | Zero Liquid Discharge |

Timeline for Updating Forecasts

- CEI South will incorporate updates into the modeling that are received by mid November. Additionally, CEI South is considering updating near term gas costs based on NYMEX per stakeholder feedback.

| Vendor Name | Future Updates |
|-------------|---|
| ABB Hitachi | Hitachi is currently targeting a mid-Nov release for the Fall 2022 Power Reference Case that will incorporate major clean energy and transportation related provisions under the Inflation Reduction Act of 2022. |
| EVA Inc | Updates were delivered in September. |
| S&P Global | The Q3 2022 Power Forecast will be available on October 19 th , 2022. |
| Wood Mac | The next LTO will be in November 2022. |

NYMEX Futures as of 10/3/22
